Cape Fear Country Club Rehabilitation Project

The original portion of the Cape Fear Country Club Rehabilitation Project has been completed. A second phase has been added, which will rehabilitate gravity sanitary sewer mains along several streets in the downtown area and other streets throughout the county in need of repair (see maps below). The rehabilitation process begins with cleaning and televising the sewer mains. Any defects found within the sewer main are noted on televising reports. Defects can include cracked or broken pipe, holes, offset joints, etc. The reports will determine the method of rehabilitation with excavated point repair and/ or lining the sewer main.

As of March 26th, 2020, most of the sewer mains have been cleaned and televised. The few that remain (all in the downtown area) will be completed within the next couple of months. Once all cleaning and televising has been completed, the videos will be reviewed to determine if any repairs need to be completed before lining of the sewer mains begin.

This project is anticipated to be completed by the end of September 2020.
This data is from GIS sources. The accuracy cannot be guaranteed and should not take the place of a field survey.
